

Research training / project work /Internship proposal - New cleaning product

*We're a technical company based in Uppsala called HMG.
We would like to initiate a collaboration with one or two
students that would like to work on a project involving the
study of Sodium Lauryl Sulfate which will be in the new
cleaning product(s) we aim to launch.*

During 2022/2023 we aim to discover if our company can extend into new fields. Since 2009 we launched a successful tool called ID24 to retail companies. Today it is live in many countries. Since we have clients in the pharmacy / grocery retail business we are looking into new cleaning products for this sector.

If you are able to do a part time internship / project work this could be a fun project for you. You will be able to follow and help with this initiative from very early stages with our contacts at biotech companies for analysis, with certification processes and potential clients. If work goes well during the spring there will be an opportunity to also work for this project during the summer holidays.

Our Goals:

- Learn more about Sodium Lauryl Sulfate/similar cleaning eco substances and the environmental effects
- Discover new business opportunities for new products and broaden our perspective
- Opportunities after a successful collaboration

How we can help:

- Financial support
- Office space for work
- Company backing you up

Get in touch

You will be under the wing of a well established company with 10 years experience in the technology sector. We will work hand in hand but will also allow you the freedom to grow. In return, we get a fresh perspective on things and a mind to help shape.
